How much does compressed air energy storage cost?

Our base case for Compressed Air Energy Storage costs require a 26c/kWh storage spread to generate a 10% IRR at a \$1,350/kW CAES facility, with 63% round-trip efficiency, charging and discharging 365 days per year.

How long does an energy storage system last?

The 2020 Cost and Performance Assessment analyzed energy storage systems from 2 to 10 hours. The 2022 Cost and Performance Assessment analyzes storage system at additional 24- and 100-hour durations.

What is compressed air energy storage?

Compressed air energy storage stores electricity by compressing air in underground caverns or tanks and releasing it later through turbines. It supports the integration of renewable energy, grid stability, and efficient large-scale storage for industrial and utility systems.

How long does compressed air energy storage last?

These plants demonstrate CAES's proven long-duration capability, with storage durations ranging from 4 to 24 hours and performance measured by capacity factor, grid support, and dispatch reliability. How does Compressed Air Energy Storage work?

Which energy storage technologies are included in the 2020 cost and performance assessment?

The 2020 Cost and Performance Assessment provided installed costs for six energy storage technologies: lithium-ion (Li-ion) batteries, lead-acid batteries, vanadium redox flow batteries, pumped storage hydro, compressed-air energy storage, and hydrogen energy storage.

What types of energy storage systems are available?

Various energy storage systems are available, including pumped hydro, battery energy storage, flywheel energy storage, thermal energy storage, hydrogen energy storage, supercapacitor energy storage, compressed natural gas (CNG) storage, and mechanical energy storage. Let's compare CAES with some of these systems.
