Can lithiated nickel manganese cobalt oxide be produced by co-precipitation?

A process model has been developed and used to study the production process of a common lithium-ion cathode material, lithiated nickel manganese cobalt oxide, using the co-precipitation method. The process was simulated for a plant producing 6500 kg day⁻¹.

Why are nickel-metal hydride batteries expensive?

Nickel-metal hydride batteries exhibit relatively high raw material cost due to large amounts of nickel. These batteries are also subject to commodity price fluctuations of nickel, leading to pack cost of 250 USD/kWh in the worst case.

Are lithium and cobalt prices market-reflective?

This includes benchmark prices for lithium and cobalt, two battery materials that continue to experience market volatility and supply/demand imbalances. Our widely used prices are market-reflective, assessing both the buy- and sell-side of transactions.

Does raw material cost affect lithium-ion battery pack prices?

The analysis shows that each material only contributes a minor share to total raw material cost. In addition, total raw materials cost only constitute a share of total product price. The cost increase of one raw material will therefore only have a limited impact on lithium-ion battery pack prices.
