

Energy storage cabin model demonstration

What are the dimensions of the energy-storage cabin?

The dimension selected for the energy-storage cabin is 5.89 × 2.35 × 2.39 m³. The battery cells are based on the CATL 100AH LiFePO₄ battery, and the final model dimension of the lithium-ion batteries is 280 mm × 280 mm × 160 mm. Given the substantial weight of the lithium-ion batteries, a 2 mm medium-duty shelving layer is chosen.

How to simulate a battery cabin?

Firstly, a simulation model is established according to the actual battery cabin, which divided into two types: with and without guide plate. Then, at the environment temperature of 25°C, the simulation air cooling experiment of the battery cabin was carried out. The working condition of module was 1C, and the air speed was set to 4m/s.

What is lithium-ion battery energy storage cabin?

Lithium-ion battery energy storage cabin has been widely used today. Due to the thermal characteristics of lithium-ion batteries, safety accidents like fire and explosion will happen under extreme conditions. Effective thermal management can inhibit the accumulation and spread of battery heat.

How does a ventilation vent affect cabin temperature?

When the ventilation vent is located closer to the batteries, cabin temperatures reach higher peaks and smoke concentrations peak earlier. Effective smoke circulation between the ventilation port and the door further enhances cabin temperature peaks and significantly advances the time when smoke concentrations reach their maximum.
