How is shared energy storage determined?

For the shared energy storage parameter setting, the total capacity is determined based on the average hourly electricity demand load of each residential consumer. For both data sets, we consider three energy storage units such that each unit has the same energy storage capacity.

What is a shared energy storage control policy?

For this, we design a structured shared energy storage control policy that comprises time-varying minimum charging requirements and maximum discharging allowances defined for each residential consumer.

Does energy storage play a significant role in smart grids and energy systems?

Abstract: Energy storage (ES) plays a significant role in modern smart grids and energy systems. To facilitate and improve the utilization of ES, appropriate system design and operational strategies should be adopted.

Is energy storage a distinct asset class within the electric grid system?

The authors support defining energy storage as a distinct asset class within the electric grid system, supported with effective regulatory and financial policies for development and deployment within a storage-based smart grid system in which storage is placed in a central role.

Does the energy storage strategic plan address new policy actions?

This SRM does not address new policy actions, nor does it specify budgets and resources for future activities. This Energy Storage SRM responds to the Energy Storage Strategic Plan periodic update requirement of the Better Energy Storage Technology (BEST) section of the Energy Policy Act of 2020 (42 U.S.C. § 17232 (b) (5)).

What is shared energy control policy based on static assignment and dynamic capacity sharing?

For the shared energy control policy based on the static assignment and dynamic capacity sharing, we design a structured control policy that is uniquely designed to specify (i) minimum charging requirement and (ii) maximum discharging allowance for each individual consumer in each discrete time period.
