How can energy storage power stations be evaluated?

For each typical application scenario, evaluation indicators reflecting energy storage characteristics will be proposed to form an evaluation system that can comprehensively evaluate the operation effects of various functions of energy storage power stations in the actual operation of the power grid.

Which energy storage power station has the highest evaluation Value?

Calculation results of relative closeness. According to the evaluation values of the operational effectiveness of various energy storage power stations, station F has the highest evaluation value and station C has the lowest evaluation value.

How can energy storage power stations be improved?

Evaluating the actual operation of energy storage power stations, analyzing their advantages and disadvantages during actual operation and proposing targeted improvement measures for the shortcomings play an important role in improving the actual operation effect of energy storage (Zheng et al., 2014, Chao et al., 2024, Guanyang et al., 2023).

Which power station has advantages over other power stations?

For example, Station A has advantages over other power stations in terms of comprehensive efficiency and utilization coefficient, while it is relatively insufficient in terms of offline relative capacity, discharge relative capacity, power station energy storage loss rate, and average energy conversion efficiency. Fig. 6.

How do you rank energy storage power stations?

Rank the energy storage power stations based on their relative closeness degree  $C_i$ . The closer  $C_i$  is to 1, the closer it is to a positive ideal solution, and the higher it is in the ranking of advantages and disadvantages. 4.3.
