Can shared energy storage be implemented in residential communities?

Hence, there have been significant efforts to implement shared energy storage in residential communities. For example, three 34 kWh energy storage units that were each shared among 5 to 15 houses were installed in Sacramento, California's Anatolia III Solar Smart Homes Community .

Is shared energy storage better than individual energy storage?

The results of the numerical experiments show that shared energy storage has economic and operational benefits over individual energy storage. Specifically, cost savings between 2.53% and 13.82% and energy storage utilization improvements between 3.71% and 38.98% exist when using shared energy storage instead of individual energy storage.

What is shared energy storage?

With shared energy storage, multiple consumers will have access to the energy storage by charging and discharging the energy storage depending on their own needs. In this case, consumers can reduce the burden of the installation of energy storage by sharing initial investment costs.

Does shared energy storage reduce investment and operational costs?

Although previous studies almost universally conclude that shared energy storage reduces investment and operational costs and improves storage use, increases solar-power consumption, shaves peak demand, etc., our study provides a more fair comparison of individual and shared energy-storage operations than the simulation techniques.

Does shared energy storage have Dynamic assignments?

We acknowledge that in real-world shared energy storage application, dynamic assignments can occur. Specifically, in real-world practice, residential consumers can charge their excess solar generation to other shared energy storage units when their assigned energy storage is full.

How to integrate the assignment with shared energy storage operations?

To integrate the assignment with the shared energy storage operations, we consider a two-stage decision-making framework where the assignment will be determined in the first stage, and then, it will be fixed while finding optimal shared storage operations across multiple days in the second stage.
