Why do we use solar photovoltaic & battery energy storage at bus depots?

The inspiration for our research emerged from the growing focus on integrating transportation with renewable energy systems. We were interested in the energy island and self-sufficiency in the beginning. Therefore, we introduce solar photovoltaic (PV) and battery energy storage at bus depots (charging hubs).

Can electric buses be used as energy hubs?

In the past four years, research has expanded to include electric buses (EBs) within this framework. Liu et al. (2024) explored transforming bus stations into energy hubs using data from over 200 million GPS records from nearly 21,000 buses in Beijing 21.

Can a single bus depot be an energy hub?

The integrated system also reduces grid charging loads by 49.35%, alleviating grid stress. In contrast to an existing study that focuses on electrifying entire bus networks in cities such as Beijing 21, our approach focuses on optimizing a single bus depot that operates as an energy hub.

Should bus depots offer shared charging services?

Offering shared charging services at bus depots provides economic benefits for public transportation agencies through additional revenue from electricity and service fees. Furthermore, integrating PV and BES systems at shared bus depots could improve PV utilization and lower peak electricity demand from the power grid.

Are bus charging stations good for EV charging?

Bus charging stations are generally equipped with sufficient high-power chargers, and their dispersed locations throughout the city make them ideal for complementing EV charging networks.

Is battery energy storage a viable alternative to solar PV?

Although battery energy storage (BES) has emerged as an effective solution to enhance solar PV utilization and mitigate grid impacts 10, declining battery costs over the past decade, they remain relatively expensive compared to the solar PV system 11.
