Can ultrahigh energy density and power density overcome the capacity-speed trade-off?

This simultaneous demonstration of ultrahigh energy density and power density overcomes the traditional capacity-speed trade-off across the electrostatic-electrochemical energy storage hierarchy^{1,16}.

Can grid-forming energy storage systems improve system strength?

It is commonly acknowledged that grid-forming (GFM) converter-based energy storage systems (ESSs) enjoy the merits of flexibility and effectiveness in enhancing system strength, but how to simultaneously consider the economic efficiency and system-strength support capability in the planning stage remains unexplored.

Can electrostatic capacitors amplify energy storage per unit planar area?

However, electrostatic capacitors lag behind in energy storage density (ESD) compared with electrochemical models^{1,20}. To close this gap, dielectrics could amplify their energy storage per unit planar area if packed into scaled three-dimensional (3D) structures^{2,5}.

Are electrostatic microcapacitors the future of electrochemical energy storage?

Moreover, state-of-the-art miniaturized electrochemical energy storage systems--microsupercapacitors and microbatteries--currently face safety, packaging, materials and microfabrication challenges preventing on-chip technological readiness^{2,3,6}, leaving an opportunity for electrostatic microcapacitors.

How do superlattices increase storage per footprint?

Third, to increase the storage per footprint, the superlattices are conformally integrated into three-dimensional capacitors, which boosts the areal ESD nine times and the areal power density 170 times that of the best-known electrostatic capacitors: 80 mJ cm⁻² and 300 kW cm⁻², respectively.

What is the difference between continuous HZO and superlattice approach?

Compared with the continuous HZO approach, the superlattice approach maintains the ideal energy storage properties on increasing thickness, namely, (1) field-induced NC charge boost, (2) enhanced permittivity during the antiferroelectric-to-ferroelectric phase transition, and (3) high breakdown field (Fig. 2j).
