

Progress trends of carbon materials for energy storage

Why are carbon-based nanostructures a leading material in energy storage and conversion technologies?

In this context, carbon-based nanostructures have emerged as leading materials in energy storage and conversion technologies due to their electrical, mechanical, and optical properties, easily tunable morphologies, high surface area, and high thermal and chemical stabilities. [18, 28 - 31]

Why are carbon materials important for energy conversion & storage?

Therefore, carbon materials with attractive features, such as tunable pore architectures, good electrical conductivity, outstanding physicochemical stability, abundant resources, and low cost are highly desirable for energy conversion and storage.

What are carbon-based nanomaterials?

Carbon-based nanomaterials, including graphene, fullerenes, and carbon nanotubes, are attracting significant attention as promising materials for next-generation energy storage and conversion applications.

What are the three types of carbon nanostructures for electrochemical energy storage?

In this review, we have explored the latest advancements in these three types of carbon nanostructures (graphene, CNTs, and fullerenes) for electrochemical energy storage, including supercapacitors, Li-ion/Na-ion batteries, and HER. The development and various properties of these three carbon forms are depicted in Figure 1.

Can carbonaceous materials be used in energy storage devices?

Further, applications of carbonaceous materials in energy storage devices such as supercapacitors, lithium-sulfur batteries, lithium-ion batteries, sodium-ion batteries, etc., are reviewed, which have never been addressed simultaneously in literature. Furthermore, the advantages and disadvantages of biomass-derived materials have been discussed.

How do porous carbon premised materials improve energy storage capacity?

Energy storage capability is improved by porous carbon premised materials, linked with micro/meso/macropores. Ion adsorption, ion transport, and ion reservoirs are all active sites for these hierarchical pores. The energy storage capacity and the rate capability of hierarchical porous carbon are both quite high.
