Can a solar energy harvesting system use an on-chip power source?

An on-chip power source is implemented with the optimized solar cells and the proposed energy harvesting system. Measurement results demonstrate that the proposed on-chip power source can deliver an output voltage of approximately 1 V, with a maximum power conversion efficiency of 10.20% from end to end.

What is an on-chip solar cell?

This on-chip solar cell is used for on-chip energy harvesting, achieving a maximum end-to-end conversion efficiency of 10.20%, referring to the overall efficiency from incident light power to load power output.

Can on-chip integrated energy harvesting systems collect solar energy in microsensors?

The application of on-chip integrated energy harvesting systems to collect solar energy in microsensors has been successfully implemented in various studies [11,12]. The proposed on-chip power source comprises an energy harvesting system and solar cells.

How are enhanced on-chip solar cells fabricated?

The enhanced on-chip solar cells and the corresponding energy harvesting system, forming the on-chip power source, were fabricated at a wafer foundry. Both the optimized on-chip solar cells and the on-chip power source were subsequently tested under illumination from a solar simulator.

Can solar energy be used as a energy storage system?

Existing compressed air energy storage systems often use the released air as part of a natural gas power cycle to produce electricity. Solar power can be used to create new fuels that can be combusted (burned) or consumed to provide energy, effectively storing the solar energy in the chemical bonds.

Who can benefit from solar-plus-storage systems?

Ultimately, residential and commercial solar customers, and utilities and large-scale solar operators alike, can benefit from solar-plus-storage systems. As research continues and the costs of solar energy and storage come down, solar and storage solutions will become more accessible to all Americans.
