

Thorium-based solar energy storage

What types of facilities use thermal energy storage with molten salts?

There are several types of facilities that use thermal energy storage with molten salts, such as concentrated solar power plants (CSP plants) or nuclear hybrid energy systems (NHES). A CSP plant is a power production facility that uses a broad array of reflectors or lenses to concentrate solar energy onto a small receiver.

What is molten salt thermal energy storage?

This energy storage can be accomplished using molten salt thermal energy storage. Salt has a high temperature range and low viscosity, and there is existing experience in solar energy applications. Molten salt can be used in the NHES to store process heat from the nuclear plant, which can later be used when energy requirements increase.

What is an example of a CSP plant with thermal energy storage?

An example of a CSP plant with thermal energy storage is the Solar Two power plant, operated by the U.S. Department of Energy. The Solar Two program was operated to validate sophisticated CSP technologies using molten salt and was built using existing facilities from the Solar One pilot plant.

What are the three types of thermal energy storage?

Thermal Energy Storage (TES) can be divided into three areas: sensible heat materials (solid and water), latent heat (phase change materials) and thermochemical (endothermic chemical reversible reactions) (Cabeza, 2014).
