

Wiring of energy storage power supply aging equipment

What are some articles about aging equipment?

Numerous articles from IEEE Power and Energy Magazine and Electrification magazine explore the topic of aging equipment in greater detail. These articles include: Mancheng Yi; Meina Pu; Zhaofang Zhu; Chunhui Gu; Haibo Su; Xiaohua Wang, International Conference on Condition Monitoring and Diagnosis (CMD), 2016.

What happens after a power distribution system is installed?

After that, the assets used should be evaluated to detect aging, and ineffective assets should be replaced with new assets. With the installation of a new asset, the asset is born in the power distribution system. It then enters the operation procedure until its aging is detected and needs to be moved.

Why are electrical power assets reaching their end of service life?

In particular in North America and other developed countries, the number of electrical power assets reaching their end of service life increased in recent years. This is due the fact that most of the asset population has been put into operation during the boom years 40-50 years ago.

How can aging assets be a roadmap for managers and engineers?

This framework can serve as a roadmap for managers and engineers in addressing the challenges of aging assets, helping them use scientific and efficient methods to mitigate the negative effects of aging and extend the useful life of assets. Table 10 categorizes numerous articles in the fields presented for different assets. Table 10.

How does aging affect system performance?

This issue becomes significant as assets, networks, and systems gradually deteriorate over time, necessitating effective and efficient management to maintain and extend their useful life. Managing aging assets involves identifying, evaluating, and adopting appropriate strategies to mitigate the negative impacts of aging on system performance.

How to detect aging assets and asset overhaul?

Also, smart or traditional measurement, done by sensors or manual measurement, can help detect aging assets and asset overhaul. As can be seen, most studies have been done in the field of defects of worn-out assets, and the least study has been done in planning visits to worn-out assets.
